

Magic Constants

Name	Description
<code>__LINE__</code>	The current line number of the file.
<code>__FILE__</code>	The full path and filename of the file. If used inside an include, the name of the included file is returned. Since PHP 4.0.2, <code>__FILE__</code> always contains an absolute path with symlinks resolved whereas in older versions it contained relative path under some circumstances.
<code>__DIR__</code>	The directory of the file. If used inside an include, the directory of the included file is returned. This is equivalent to <code>dirname(__FILE__)</code> . This directory name does not have a trailing slash unless it is the root directory. (Added in PHP 5.3.0.)
<code>__FUNCTION__</code>	The function name. (Added in PHP 4.3.0) As of PHP 5 this constant returns the function name as it was declared (case-sensitive). In PHP 4 its value is always lowercased.
<code>__CLASS__</code>	The class name. (Added in PHP 4.3.0) As of PHP 5 this constant returns the class name as it was declared (case-sensitive). In PHP 4 its value is always lowercased.
<code>__METHOD__</code>	The class method name. (Added in PHP 5.0.0) The method name is returned as it was declared (case-sensitive).
<code>__NAMESPACE__</code>	The name of the current namespace (case-sensitive). This constant is defined in compile-time (Added in PHP 5.3.0).
